

YASH SOLANKI

Application Support Engineer | OSS/BSS & CRM Platforms | ITIL v4

Voorburg, Netherlands | +31-682684403 | solankiyash7227@gmail.com

LinkedIn: linkedin.com/in/yashsolanki27

Work Authorisation: Netherlands (HSM Visa – Transferable to IND Recognised Sponsors)

Profile Summary

Application Support Engineer with 3+ years' experience across enterprise CRM and OSS/BSS platforms in telecom, including a 100M+ subscriber government deployment (BSNL, India). Skilled in ITIL v4 Incident Management, Root Cause Analysis (RCA), SLA Compliance, SQL/MySQL data validation, Role-Based Access Control (RBAC), and REST/SOAP API testing (Postman). Experienced with Microsoft 365 and Azure AD administration, JIRA, BMC Remedy, and Zendesk in Agile/Scrum delivery environments. Currently at FGS B.V., Netherlands, on a transferable HSM visa – targeting Application Support Engineer, ICT Engineer, and Functioneel Beheer roles.

Core Skills

Application Support & ITSM: L2/L3 Application Support, ITIL v4 Incident Management, Root Cause Analysis (RCA), SLA Compliance, MTTR Reduction, Escalation Management, Role-Based Access Control (RBAC), Microservices Environment Troubleshooting

Telecom Domain: OSS/BSS, CRM, Order-to-Activate (O2A), Provisioning & Activation

Databases & Operating Systems: MySQL (Data Validation), SQL, Linux/Unix

Cloud & Enterprise Platforms: Microsoft 365 Administration, Azure AD (User Access & Sync Management), Docker, Kubernetes

API & Enterprise Tools: Postman (REST/SOAP APIs), JIRA, Zendesk, BMC Remedy

Delivery & Methodologies: Agile/Scrum (User Stories), Release Deployment, Functional/Flow Testing, Defect Management

Scripting & AI-Assisted Tools: Python (Log Parsing & Automation), Claude (AI-Assisted Documentation)

Professional Experience

Application Support Engineer — FGS B.V.

Rijswijk, Netherlands | Jun 2026 – Present

- Managed day-to-day incident resolution across the CRM application, resolving workflow failures, access issues, and system errors within SLA targets.
- Administered Microsoft 365 and Azure AD — resolved user access requests, sync errors, and login/authentication issues for end users.
- Built Python scripts to automate log parsing during RCA, isolating recurring error patterns faster than manual review, and used Claude to accelerate incident documentation and RCA write-ups — reducing investigation turnaround time.
- Supported Functioneel Beheer activities: liaised with business users to clarify issue reports and translate them into resolution steps within the application.

Senior Engineer — Whale Cloud Technology India Pvt Ltd

Hyderabad, India | Apr 2025 – Jan 2026

- Reduced workflow exception queues across a 100M+ subscriber environment, measured by an 18% increase in Order-to-Activate (O2A) throughput, by applying ITIL v4 incident management frameworks to resolve CRM-to-OSS state-transition blocks, collaborative waiting failures, and masterless order discrepancies via system reconfig.
- Minimized production downtime from critical backend exceptions, measured by a 40% reduction, by performing deep RCA on “Next Tache” calculation errors and parsing application logs in Linux/Unix environments across microservices-based distributed systems.
- Secured zero-defect data integrity between CRM and OSS, measured by correcting spatial parameters for 2,400+ service instances and migrating 55,000+ active directory numbers across CDOT, Huawei, and UTStarcom cores, by executing targeted MySQL queries.
- Mitigated critical interface integration delays at ISAP and OFM portals, measured by a 35% reduction, by executing REST/SOAP API payload analysis in Postman and eliminating provisioning bottlenecks for 1,200+ DSLAM/LMG network nodes under Agile/Scrum.
- Accelerated post-release stabilization, measured by a 30% improvement, by executing functional testing of end-to-end business flows and tracking defects in JIRA with Dev/Architecture teams.

- Accelerated critical fault resolution, measured by a 25% improvement and MTTR reduction from 40 to 30 minutes across BBNW, FTTH, and NGN modules, by re-engineering L1-to-L3 workgroup mapping and correcting AS-SIGN_GROUP routing logic within BMC Remedy.
- Secured system access for 2,500+ Pan-India telecom operators across the South Zone, measured by eliminating 250+ duplicate user profiles, by executing strict RBAC policies within Zsmart OSS.
- Maintained 99.5% SLA compliance across 3 major tech hubs (Bengaluru, Pune, Hyderabad), measured by consistently cleared L2 bottlenecks, by analyzing daily/weekly operational reports (MIS, Pending Dockets, Average Ticket Duration).
- Prevented 30% of unnecessary L3 escalations, measured by direct resolution at source, by managing high-priority B2B client communications and resolving L1 authentication faults.

Key Project

Zsmart 9.2 Platform Upgrade — BSNL (Government of India) — Whale Cloud Technology & Tenet | *Oct 2022 – Jan 2026*

- Maintained system availability during the upgrade across BSNL's 100M+ national subscriber base, measured by a 20% reduction in planned migration window overruns, by executing live cutover support and production validation.
- Secured post-release data stability, measured by resolving 3,500+ critical database migration discrepancies before impacting active billing cycles, by executing targeted MySQL queries to audit backend data consistency.
- Guaranteed seamless order activation across network layers, measured by validating 40+ distinct end-to-end business flows, by parsing system logs to resolve state-transition blocks in the modernized microservices architecture.
- Ensured deployment readiness, measured by tracking 180+ critical defects in JIRA across OSS/BSS, CRM, CPQ, DSCM modules, by executing rigorous functional test cycles.
- Ensured zero downtime for active directory lines, measured by real-time provisioning checks, by managing operational integration of the Huawei CDOT voice module.

Education

B.E. – Computer Science

Rajiv Gandhi Proudhyogiki Vishwavidyalaya, Bhopal | 2016 – 2020
